24-9-26 Ex. 13 Implement your own ping program

AIM:

To implement a simple pgm to check connectivity between two network devices.

THEORY:

Ping is a network connectivity test to check whether a destination device is reachable through a network. It sends a request to destination and waits for a reply of reply is received connection is successful.

REQUIREMENTS:

Computer

Python / suitable pgming environment

Network connectin.

Procedure:

1) Create a new pgm for implementation ping operation.
2) Import required socket / network library
3) Get IP address or host name of destination.
4) Create a socket for communication.
5) Send req packet to destination
6) Wait for response from destination.
7) If a response is received, display that destination is reachable.
8) Reach process for required no of packets.
9) Display result and close the connection.

Algorithm:

1) start
2) Enter destination IP address
3) Create a socket.
4) Send a ping request
5) Wait for response
6) If response is received
7) otherwise display Host is unreachable
8) Stop

RESULT:

9/8/24 10

Thus ping program was successfully implemented.
