1-10-21 Ex: 14 Raw Sockets Packet Sniffing

AIM:

To write a pgm using RAW sockets to implement packet sniffing.

THEORY:

A packet sniffer is a pgm used to capture and examine network packets travelling through network interface. A raw socket allows program to access network packets directly at lower level, like packet information such as source address, destination address.

Requirement:

Computer / Laptop
Python
Raw Socket Support
Network interface
Administrator / Root Privileges

Algorithm

1) Start the program
2) Create RAW socket
3) Find socket to required network
4) Wait for incoming network packets.
5) Capture packet using RAW socket
6) Extract packet information
7) Display packet detail
8) Stop pgm when required

Procedure:

1) Open Python IDE or terminal
2) Create Python pgm for packet sniffing
3) import socket module.
4) Create RAW Socket
5) Use recvfrom() function to receive packet.
6) Read captured packet data.
7) Display packet information
8) Regenerate some network traffic and observe captured packets.

RESULT:

Thus a RAW socket based sniffing pgm was implemented successfully.
